PROJECT BLUEPRINT

Azal Soft Platform | Community water-well operations

Executive summary

The platform connects meter readings, consumption, bills, collections and expenses in a traceable digital record. The prospective buyer is a well committee or operating entity; users include meter readers and accountants; households benefit. Better auditability and working efficiency are expected benefits, not demonstrated outcomes.

Problem and solution

Working hypothesis: fragmented records and repeated transcription make it difficult to reconcile billing, collections and cash, or resolve disputes. The solution is one workflow from an approved reading to cycle reports and financial reconciliation. Validate the underlying cause through observation of a real cycle and review of de-identified records.

Scope and claim boundaries

Proposed planning scope: 10 wells and 60 subscribers in total, subject to confirmation, over four monthly cycles after preparation. Repository functionality does not establish field readiness, live deployment or paying customers. No water savings, leakage reduction or water-safety improvement is claimed without appropriate measurements.

Initial product and deliverables

Priorities: register wells, subscribers and meters; capture and approve readings; calculate consumption and bills under approved tariffs; record receipts and payments; reconcile cash; report and close cycles. Deliverables are an operating record, traceable documents, an evaluation report and a continue, revise or stop decision.

Basis and evidence status

Prepared on 9 November 2026 using project documents and the reviewed Week 1 slides and Day 1 case. Session 5, customer and business model, is a proposed practical application: its slides were not provided. Its details are not attributed to a lecturer. Unverified prices and performance figures remain hypotheses.

FIVE SESSION APPLICATIONS

From understanding the system to testing a customer

1. The problem and our place on the map

The venture sits in digital infrastructure for well operations, at distribution and use. Water focus is primary; the intended initial change level is community. Proposed dialogues: Water for People, with Investments for Water secondary because of financial governance, not fundraising alone. Separate the affected party, adoption decision-maker and payer.

2. Technology and evidence

Testable claim: linking approved readings to bills and accounts may reduce duplicate entry and improve traceability. Compare time and accuracy with a verified reference and baseline. Current documents describe software functions, not independently validated field impact. Include recaptures, corrections and failures in the test.

3. Institutions and pilots

Identify the authorised signatory and permission to access meters and data. Start with one well, expanding only after readiness review. The operator supplies records, permissions and a responsible staff member; the team supplies setup, training, support and evaluation. Permission, baseline and a written decision rule are prerequisites.

4. Market and payer

The prospective payer controls the operating budget. Test a per-well subscription, potentially separating setup fees. Estimate reachable market from accessible buying entities, wells per entity, annual price and a defensible win share. The 60 households are not automatically 60 software buyers; grant-funded trials do not establish recurring commercial demand.

5. Customer and business model

Select an operator with recurring pain, a reachable decision-maker, a budget and a willing user. Ask about the last cycle, last error, actual alternative costs and purchase route. Present a defined scope and price, then seek a concrete next step. Verbal enthusiasm is not a purchase; a letter of intent is not revenue.

Case lesson: sustained operation

Life From Water illustrates the gap between construction and sustained operation. Our application is to assign data-entry, review, training and ongoing support responsibilities and funding. The case’s outcomes and partners must not be presented as ours.

CUSTOMER & BUSINESS MODEL

Nine connected building blocks | hypotheses to validate

Segments and value proposition

Customer segments: committees, owners and entities operating community wells. Users: readers, accountants and supervisors. Value proposition: a traceable reading-to-cash workflow supporting review and cycle closure. Verify that this is an urgent problem worth paying to solve.

Channels and relationships

Proposed channels: direct outreach, visits and referrals from operators or local partners, with permission. Relationships: onboarding, training, support and periodic review. Measure delivery cost and team capacity. No confirmed partnership is implied by this plan.

Revenue and resources

Proposed revenue: a subscription per well, with a possible separate setup charge based on actual effort. Key resources: platform, hosting, technical staff, field support and authorised data. No validated price or realised revenue is established here. Do not promise payment integration without verification.

Activities, partners and costs

Activities: development, testing, configuration, training, support and data-quality review. Potential partners: the operator, a local access facilitator and a trial funder if agreed. Costs: development, hosting, image processing, storage, support, visits and training. Measure the actual service cost per well.

Customer discovery

Interview five operators, three users and three households as a qualitative learning sample, not a representative market survey. Record pain, recurrence, evidenced cost, alternative, budget, authority, objections and next action. Obtain consent, collect minimal data and avoid publishing household identities.

Price test and economics

Set a concrete offer after estimating costs. Monthly revenue equals paying wells times subscription price. Contribution per well equals price minus variable cost. Break-even wells equal fixed monthly cost divided by positive contribution, rounded up. If interviews reveal no recurring pain, budget or practical commitment, revise the segment and offer before adding features.

EXECUTION & EVALUATION

A trial designed to produce an adoption decision

Timeline and ownership

Week 1: discovery and baseline, led by the founder and a field lead. Week 2: agreement, price, permissions and readiness, with the operator and technical lead. Cycle 1: one well; cycles 2–4: conditional expansion to the agreed scope. After cycle 4: evaluation and a signatory-approved decision. Confirm names and actual dates after agreement.

Proposed success targets

Baselines are unknown and must be measured first. Targets: approved readings for at least 95% of eligible active meters per cycle; median routine capture below 30 seconds after training, including corrections; reviewed error at most 1% against a reference; all bills linked to a reading and cycle; at least 95% of financial transactions documented; zero unexplained cash difference at close. These are targets, not achievements.

Verification and sample limits

Use dated logs, consistent timing, reference readings, invoice and voucher checks and physical cash counts. Sixty active subscribers over four cycles provide up to 240 reading opportunities, not independent observations. This alone cannot establish a low error rate with high certainty. Publish counts and denominators. Measure actual payment separately from interest.

Risks and safeguards

Connectivity: test on site; do not promise offline capability before verification. Reading errors: human review before billing. Opening-data errors: joint verification. Privacy: least-privilege access and tests of protection, backup and restoration. Adoption and budget risk: early interviews, training and a concrete price test.

Decision gate and open inputs

Expand only with stable data quality, no unresolved critical billing or security issue, support capacity, acceptable costs and written approval. Agree thresholds before the trial. Required inputs: scope and location confirmation, named buyer and signatory, baseline records, costs and test price. Final options are a paid contract, revision or stop.
